You can create one or more drawing objects within a drawing file. Each new object is called a new drawing object. You create new objects by choosing the icon for the new object and typing a command. You can create a new object in a drawing file. To create an object, choose an icon and use the commands described in the following sections. If you want to create an object with more information than AutoCAD provides,

you can refer to a custom description file (.cat) or to a custom property file (.dxf).

Creating drawing objects

Creating drawing objects by using a command is the simplest way to create objects. To create a new drawing object, choose the icon for the object you want to create and type a command. The next sections describe the different ways to create a new drawing object.

How to create a new drawing object

When you create a new drawing object, you specify the type of object you want to create and you supply a description, or optional properties, that describe the object.

AutoCAD provides standard objects and templates to make your design easier. You can use those objects or template objects in your new drawings. You can also create your own new drawing objects. You use your

drawing application to design custom objects. For example, you can use a graphic-drawing application to create vector-based objects, such as line, ellipse, polyline, polygon, spline, and spline with smoothing. You can use several ways to create a new object. See the following sections for a detailed description of each option.

Command	Type	Description
		A description of the object is optional. You can use it to provide more information to AutoCAD. You can also use a description for commands, such as zooming or resetting the zoom level.
	Object type	AutoCAD creates the object based on a predefined set of object types. The predefined object types are described in the next section. You can create any of the predefined object types. You can also

When you launch the application, after some initial windows a window shows the available layers. Right click on the layer you want to export and select Export The file will be saved in the layer folder. To add some general information to the model, you have to go to Format menu and select "Add" -> General -> Add some text, and add your information. When the export is done, you can right click on the "Export" button in the lower left of the window and select "Export to" -> "Existing file". After that, there will be a.ace extension file at the root of the layer folder. Finally, you just import the.ace file into a similar application (here Autodesk AutoCAD) and you will be able to edit and apply all changes you want. Christopher

What's New in the?

Automatic Release: Automatic Release now

works for all people in your Autodesk account and you no longer need to ask your peers for release access. You can see other people's releases and request your own right from the Change & Review center. (video: 1:55 min.)

Object-Based Database Management:

Database queries now use a new object-based index that indexes individual objects rather than entire drawings. Therefore, you can search for objects and not drawings. For example, this means you can now search for objects in your database by commonality or type. (video: 4:13 min.)

Database View:

The database views help you explore your database objects in new ways. For example, you can now use either the whole database or just the objects in a single drawing to find related drawing objects. Also, you can create a top-level view

of your entire database that presents the relationships between objects. (video: 4:42 min.) Multi-Graphics Support: Add and use multiple graphics in a single drawing. Now you can quickly switch between graphics without using the File > Switch to graphics option. (video: 2:05 min.) Autodesk 360: Now anyone can easily access and collaborate on projects through their Autodesk 360 account. Upload your 3D models and receive updates with everyone. 3D Animation: Explore and explore. Now you can create and animate 3D models and see them in 3D on the new web browser, in mobile apps, and on your favorite 360 client. (video: 1:55 min.) 3D Cameras: You can now track moving objects in your drawings on a mobile device. From the devices app, you can create and follow cameras that orbit and zoom around

objects and people in your drawings. (video: 1:54 min.) File-Based Database: Now you can create, update, and manage your database from one central location, without downloading a drawing file to your local computer. You can access the same drawing file on both your Mac and PC without needing to move it. (video: 2:03 min.) Open Design Review: Now you can invite others to review your designs using their existing Autodesk 360 account. With the new collaboration tools, they can see and annotate your drawings
